

Application Alerts

The Application Alerts is used to decide who receives the administrator alert communications for application integration points. These Notifications can include various error messages such as support inboxes failing to connect.

There are two sections in this module: **Primary Recipients** and **Additional Recipients**. Amped will inform up to the first three active admins in the Primary Recipients section, but the recipients can be modified.

In the Additional Recipients section, you can add other admins or email addresses to receive the same notification.
